RUMP SESSIONS - September 18 (Wednesday) 19:00-21:00

Rump session A (Room 212, 1F, Bldg.2)

"Toward the 100Gbps/THz Era"

Recent technologies based solid-state devices and materials are providing practical high-speed optoelectronic devices operating at over 40 Gbps. For example, the speed of digital ICs and bandwidths of transistors have been dramatically increased by using SiGe HBTs, InP HEMTs, InP HBTs, and GaN HEMTs. Some ICs are exceeding to 100 Gbps or 100 GHz. Correspondingly, cutoff frequencies of transistors are approaching THz range. Bandwidths of photodetectors and optical modulators are also exceeding 200 GHz and 100 GHz, respectively. These performance races are driven by the strong demands for future networks having large transmission capacity. It is good time to discuss the potential of emerging technologies toward the 100-Gbps era before the applications become concrete.

In the rump session, we would like to informally discuss the flowing issues; (1) Which technology is the most cost-effective in achieving 100-Gbps optical transceivers? (2) What are the device design issues? (3) How will optics and electronics fuse in a chip or a package?

Moderators	Panelists	
M. Rodwell (UC Stanta Barbara, USA)	M. Racanelli (Jazz Semiconductor, USA)	SiGe HBT
O. Wada (Kobe Univ., Japan)	T. Hierl (IQE, USA)	III-V Epitaxy
	M. Rodwell (UCSB, USA)	III-V HBT
	N. Hara (Fujitsu Lab., Japan)	III-V HEMT
Organizers	H. Ito (NTT, Japan)	Photo Detector

K. Kojima (Mitsubishi, Japan)	Y. Ueno (NEC, Japan)	OTDM

Rump session B (Room 211, 1F, Bldg.2)

" Ultimate Device Scaling versus New System Integration: Compete or Cooperate?"

Demand to higher performance and higher packing density in LSIs has accelerated the device size to be scaled down to 50 nm regime. Much smaller device with the gate length of 15 nm has been demonstrated in a research level. However, there exist so many concerns which should be solved in order to realize high performance LSIs using such ultra small device. Then, it is a time just when we should reconsider of device scaling from the viewpoint of system integration. There are possibilities to dramatically improve the system performance by employing new integration technologies combined with package technology, optoelectronic technology, MEMS technology and bio technology even though we use devices with relaxed sizes. Therefore, it is meaningful to discuss which approach of device scaling or system integration is more cost-effective to achieve future high performance systems.

In the rump session, we discuss about the future direction of integration technology from the viewpoint of device scaling based on the technology road map and new silicon integration technology merged with package technology, optoelectronic technology, MEMS technology and bio technology.

Moderators	Panelists
